

Ink Note - One-Page App Summary

What it is

Ink Note is a React + Vite note workspace with draggable note windows.

Notes can reference each other to form a graph, and workspace access is auth-gated with Clerk.

Who it is for

Primary persona: Not found in repo.

Inferred from UI copy: users who link ideas and navigate notes visually.

What it does

- Create draggable and resizable note windows on a full-screen canvas.
- Edit rich-text note content and rename notes with slug-style IDs.
- Link notes with at-mentions; links are stored as note-to-note connections.
- Show a live background graph of note relationships; click nodes to open notes.
- Search notes by title with a command-style panel and keyboard navigation.
- Show a recent-notes rail for one-click reopen and context recovery.
- Provide auth, account controls, and a light or dark theme toggle.

How it works - architecture from repo evidence

React app mounts in `src/main.tsx` with `ClerkProvider` and `ConvexProviderWithClerk`.

`App.tsx` gates UI by auth state: `AuthLandingScreen` when signed out, `WorkspaceShell` when signed in.

State lives in a persisted Zustand store in `src/store/useStore.ts`, including notes and window state.

The persist key is `ink-note-storage`, and theme preference is saved in `localStorage`.

`NoteEditor` with `TipTap` and `Mention` updates HTML content.

`updateNote` parses `data-id` spans into connections for graph edges.

`selectGraphIndex` and `buildGraphIndex` derive adjacency maps.

`BackgroundGraph` renders nodes and edges with `react-three-fiber` and opens notes via store actions.

Convex app-specific functions or schema definitions: Not found in repo.

How to run - minimal getting started

1. Install dependencies: `pnpm install`
2. Set `.env.local` values used by code: `VITE_CONVEX_URL` and `VITE_CLERK_PUBLISHABLE_KEY`.
3. Start the app: `pnpm dev`
4. If running your own Convex auth setup, configure `CLERK_JWT_ISSUER_DOMAIN` for `convex/auth.config.ts`.
